

Sheppee International Press Release

SM Module Upgrade

August 2013

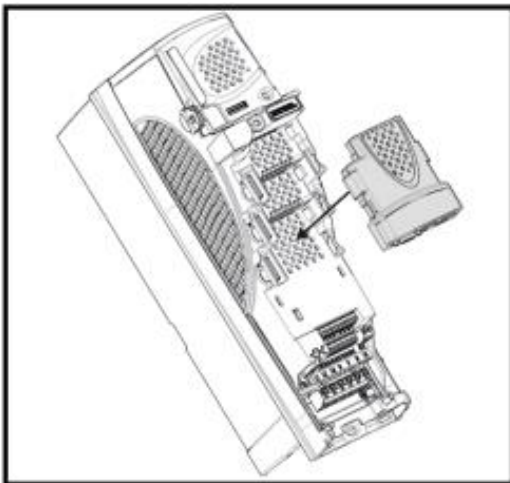

SM Application Module

SM Application Plus Module

Due to advancement in the capability of the processing power of the IPC's used on the Triflex Lehr loader, the IPC's now being installed in the machine are able to process data at a much faster rate than the IPC's previously installed.

As the transfer of data is quicker, Sheppee have identified a requirement to upgrade the SM Modules used on all the servo drives to future proof the machines. From the 19th August 2013 all Modules supplied by Sheppee International Limited for use on the Triflex Lehr Loader machine will be the SM Applications Plus Type.

This includes when requested as replacements for existing machines. There is no upgrade requirement, the two modules can just be swapped, and it is not necessary to change all modules at once as the old and new will work alongside each other.

There is no difference in price between the SM application module and SM Application Plus modules.
